DOE Review Meeting

June 06, 2006

Pollutants from Coal Combustion

- Combustion of fossil and waste fuels – release trace elements
- 11 among 187 HAPs
- Coal -major source of several

HAPs	Estimated US Emissions¹ (1994) Tons/year
Mercury	51
Beryllium	7.9
Cadmium	3.2
Chromium	62
Lead	62
Arsenic	56
Nickel	52

¹ Study of Hazardous Air Pollutant Emissions from Electric Utility Steam Generating Units – Final Report to Congress. United States, Environmental Protection Agency, February 1998. <http://www.epa.gov/ttn/oarpg/t3/reports/eurtc1.pdf>

Sources of Hg Emissions

Mercury Source	Estimated US Emissions (1994-1995)¹ Tons/year
Coal Combustion	73
Municipal Waste Combustor	30
Medical Waste Incinerator	16
Other Combustion Sources	19
Total Combustion	138
Manufacturing Sources	16
Miscellaneous sources	1
Area sources	3
Total	158

Clean Air Mercury
Rule - 70% 2018
*(reconsideration
“denied” 5/31/06)*

Several states – more
stringent rules

- *NY recent*
- *PA*

¹ *Mercury Report to Congress, 1997.*

Objectives

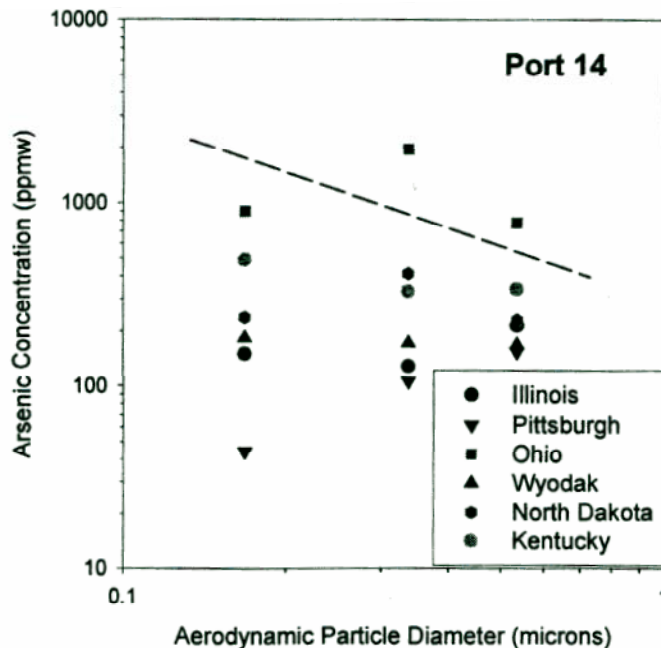

Identify fate of trace metals

- *competition between condensation and surface reaction*
- *Hg heterogeneous pathways*
- *gas-solid reactions for other elements*

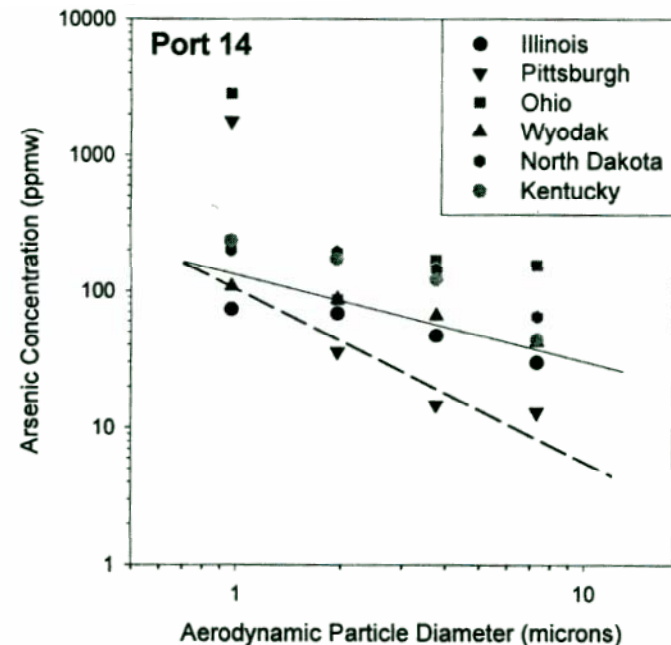

Background

- Particle Size Dependence of Arsenic in Fly Ash
 - Surface condensation (for $Kn < 1$: $\propto 1/d_p^2$, for $Kn > 1$: $\propto 1/d_p$)
 - Surface reaction ($\propto 1/d_p$)
 - Unvaporized (?)

Sub-micron particles

Super-micron particles

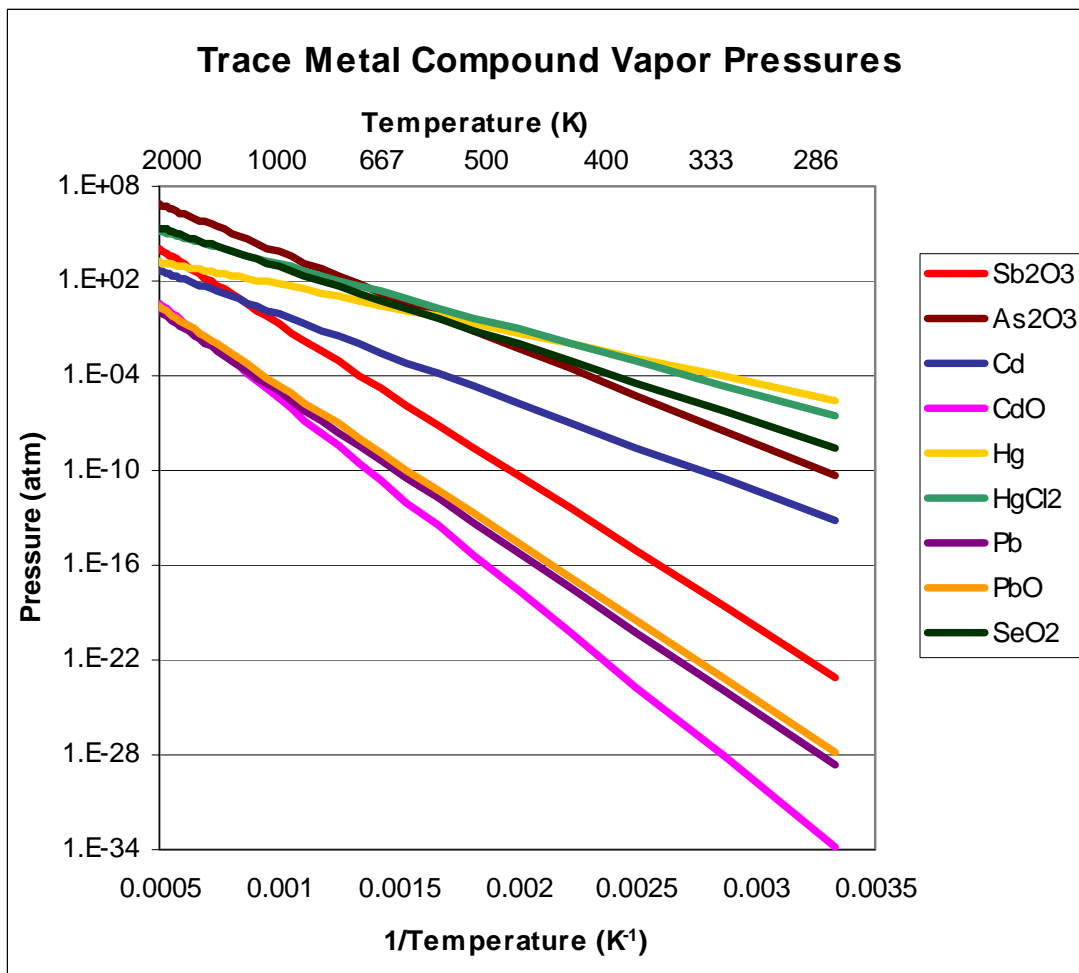

Approach

- Challenges
 - input/output only
 - scatter in data
 - assumes vaporized species dominant
- Goal – develop generalized, temporal understanding
- Measure surface reaction rates as needed
 - Classify standard fly ash
- Build transient model
 - Competing pathways of metal addition
- Challenges
 - Fly ash composition variation
 - Surface reaction rates

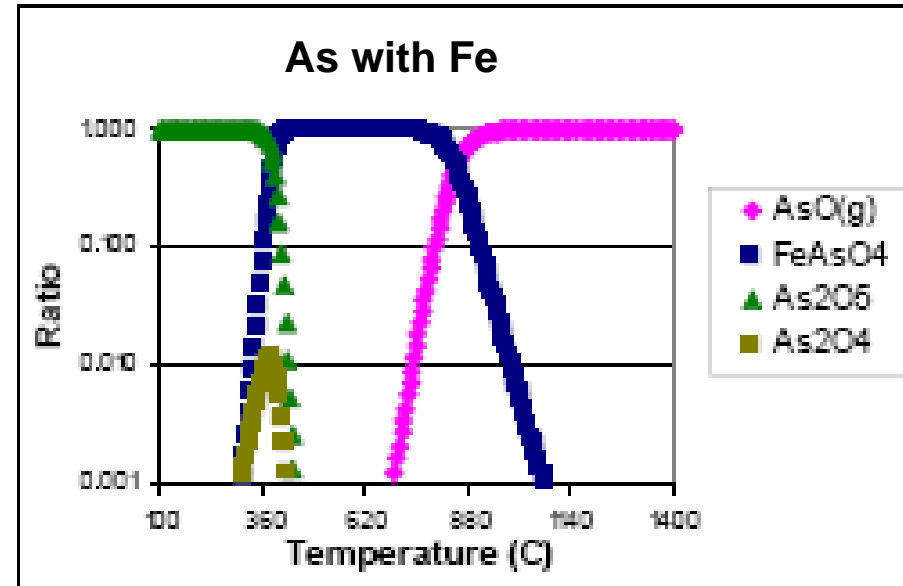

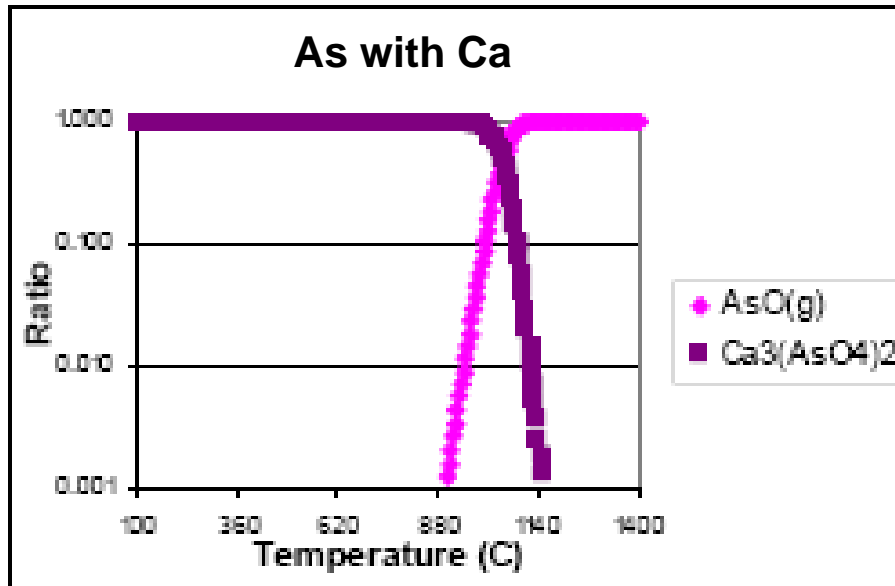

Approach: Literature Search

- Vapor pressure – dominant compounds
- Hg, Se, As, Cd most volatile
- Existing rxn rate data starting point

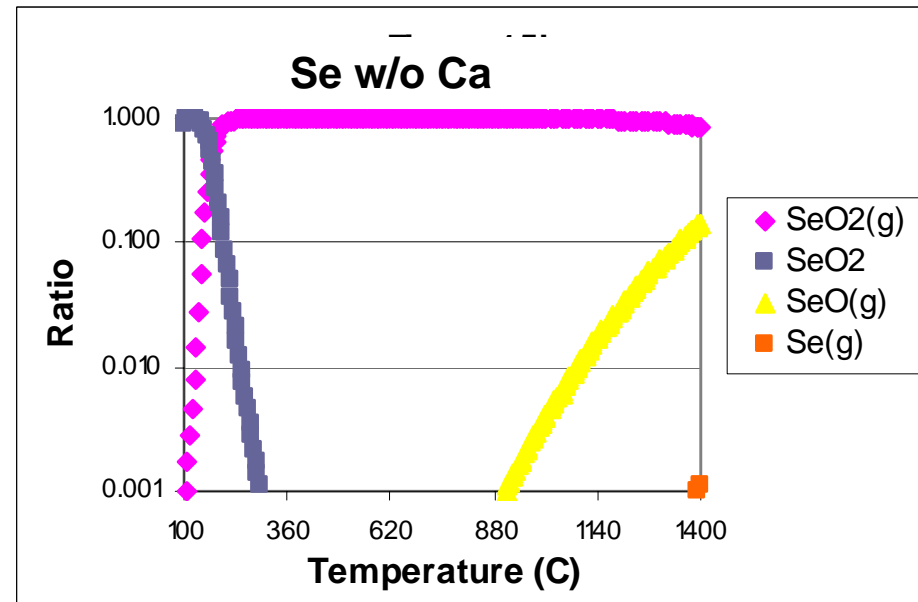

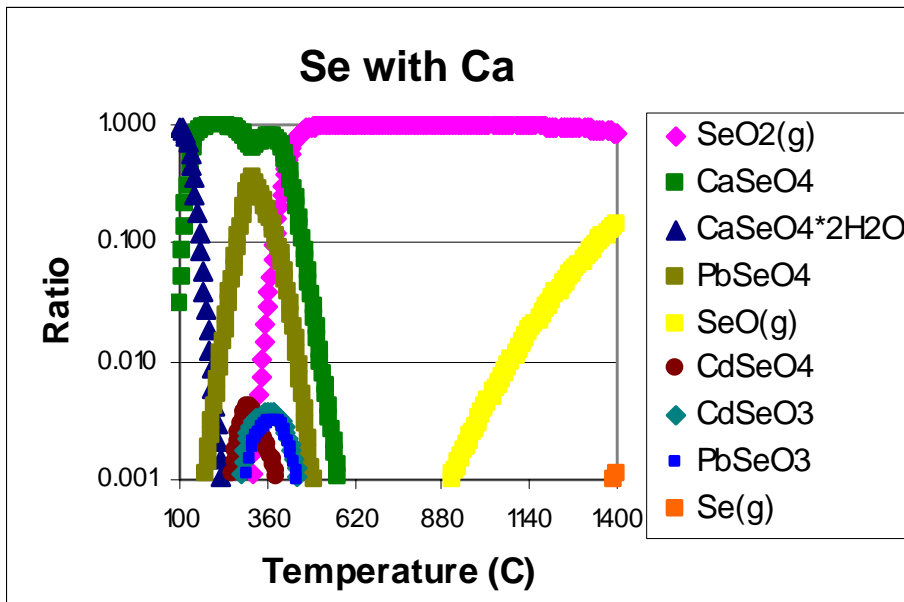

Partitioning

- Equilibrium Calculations
 - Arsenic in Ohio coal

Approach: Modeling

- Equilibrium Calculations
 - Selenium in Ohio coal

Model

- Time dependent addition (g metal/s)
- Variables
 - Vaporized metal fraction
 - Surface area factor
 - Quench rate

$$M(d_p) = \frac{6}{\pi d_p^3 \rho_{ash}} \sum_{t=0}^{t=t_f} [K_R(d_p, t) + K_C(d_p, t)] \delta t$$

Approach: Modeling

- Single Particle Model
 - Time-dependent

- Currently studying
 - Kentucky Coal
 - Arsenic

- Addition by reaction

$$K_R = \frac{\pi d_p^2 k_{Ca} P_i}{RT}$$

- Addition by Condensation
 - Continuum Regime

$$K_C = \frac{2\pi d_p D_i (P_i - P_i^{sat})(1 + Kn)}{RT(1 + 1.71Kn + 1.33Kn^2)}$$

- Free Molecular Regime

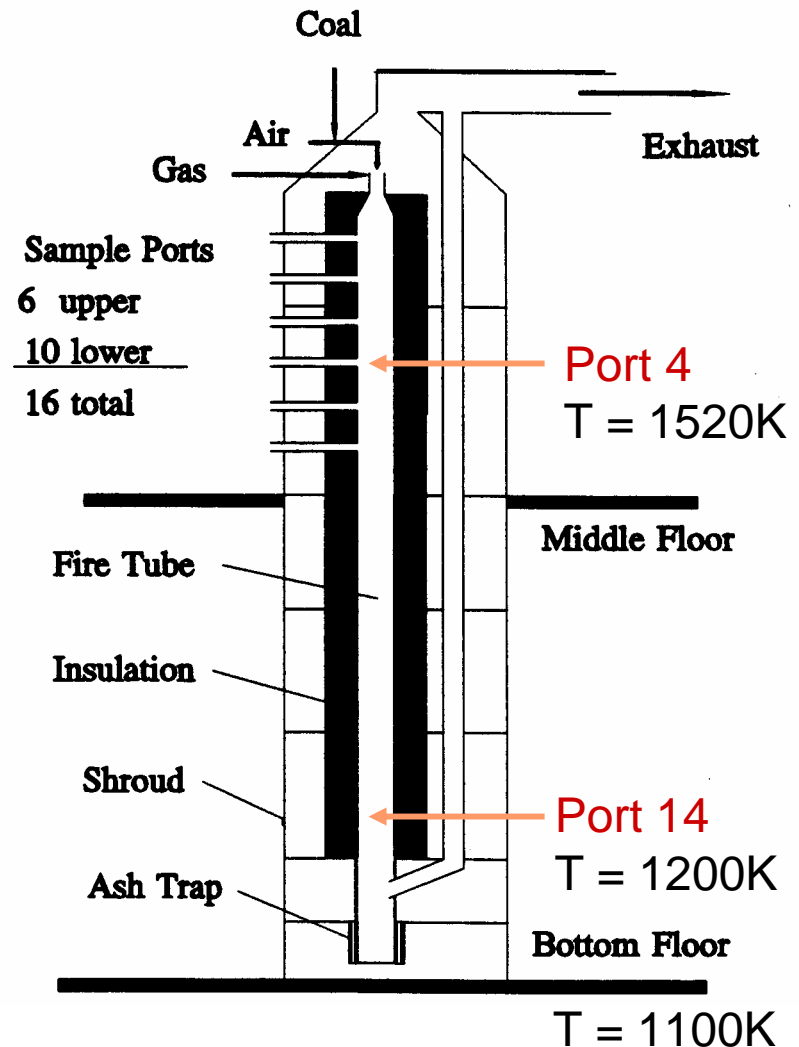

$$K_C = \frac{\phi \pi d_p^2 (P_i - P_i^{sat}) MW^{\frac{1}{2}}}{(2\pi RT)^{\frac{1}{2}}}$$

Model Inputs from Data

- System
 - Temperature Profile
 - Ash Content
(g ash/g coal)
 - Metal Content
(g metal/g coal)
 - Coal and Combustion
Gas flowrates
- Ash Characteristics
 - Particle size distribution
 - Calcium oxide mass
fraction

Approach: Modeling

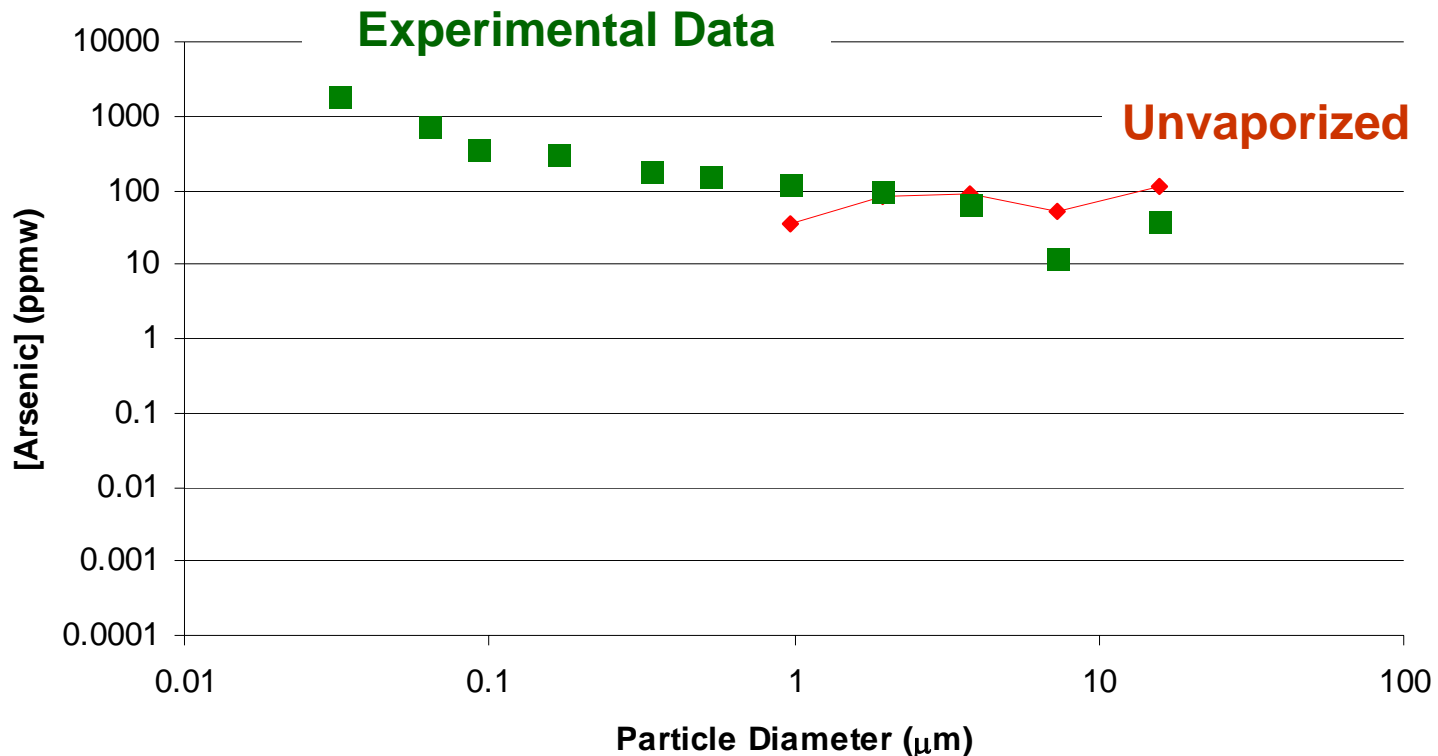

- Experimental data
 - University of Arizona⁴

⁴ PSI Technology Company. "Transformations of Inorganic Coal Constituents in Combustion Systems." Volume II, November 1992. Contract No. DE-AC22-86PC90751

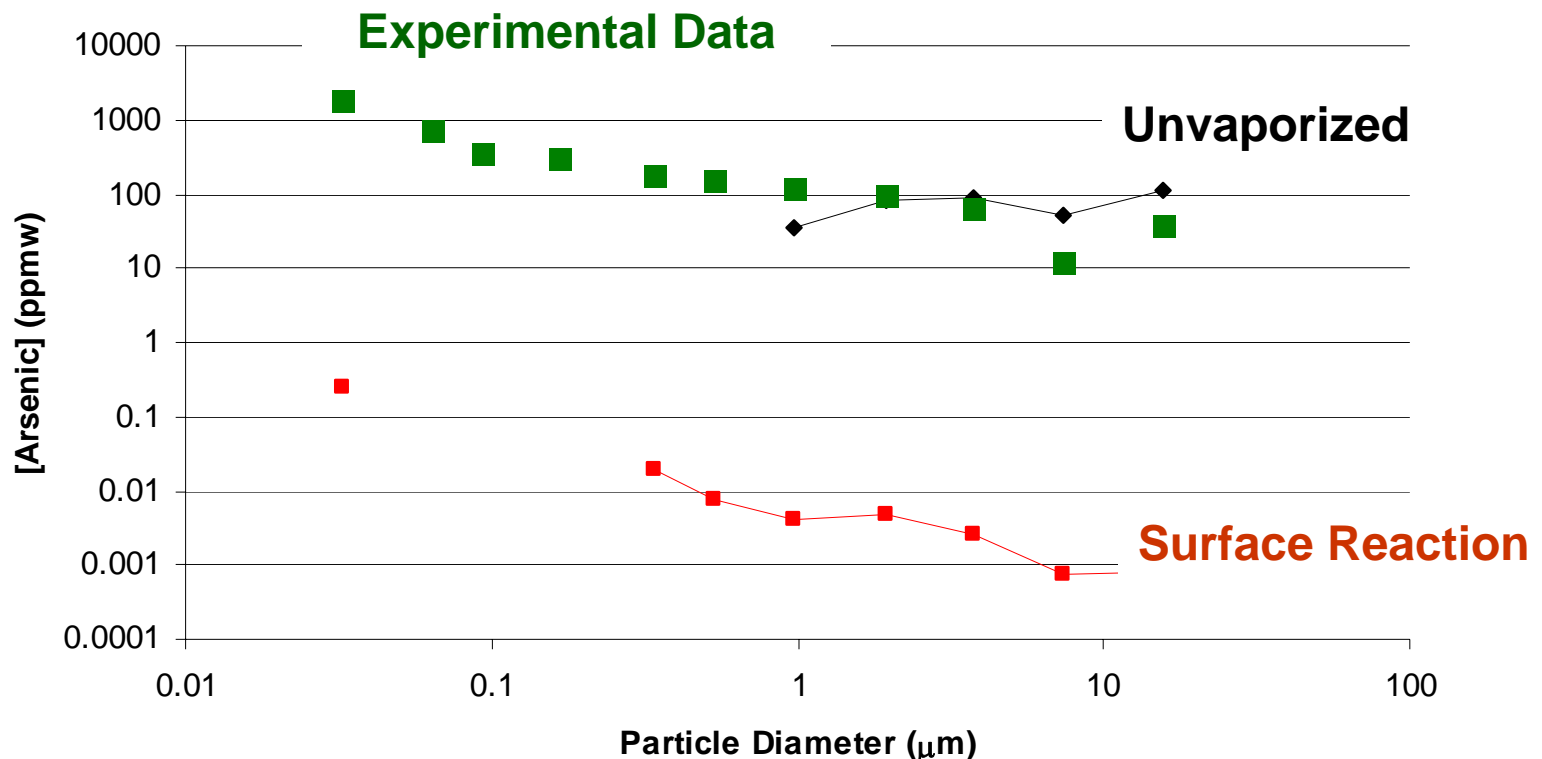

Arsenic Addition by Process

- Kentucky Coal
Port 4, Run 4
 - Vaporized arsenic fraction = 60%
 - Surface area factor = 1
 - Quench Rate = 1000 K/s

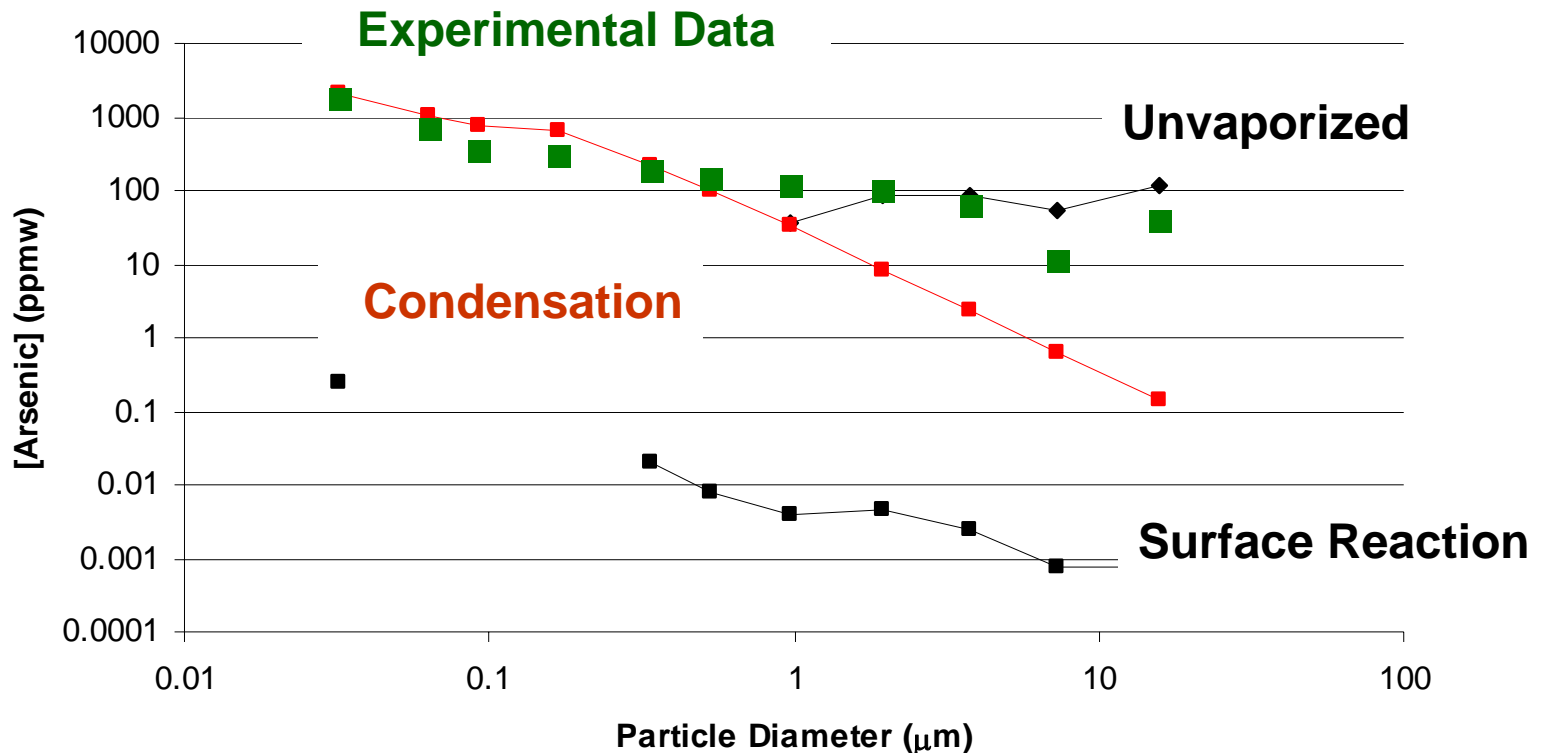

Arsenic Addition by Process

- Kentucky Coal
Port 4, Run 4
 - Vaporized arsenic fraction = 60%
 - Surface area factor = 1
 - Quench Rate = 1000 K/s

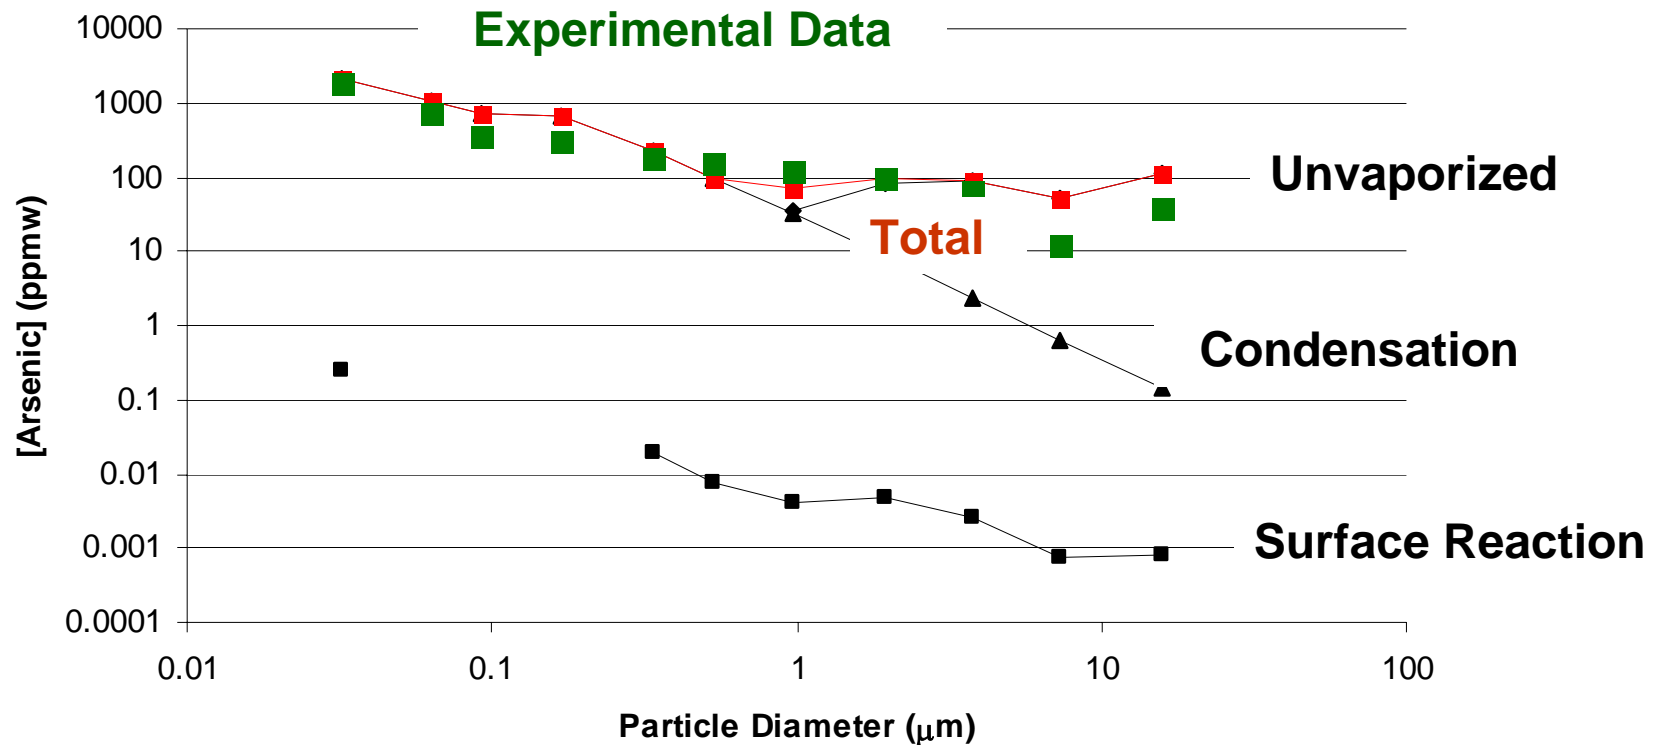

Arsenic Addition by Process

- Kentucky Coal
Port 4, Run 4
 - Vaporized arsenic fraction = 60%
 - Surface area factor = 1
 - Quench Rate = 1000 K/s

Arsenic Addition by Process

- Kentucky Coal
Port 4, Run 4
 - Vaporized arsenic fraction = 60%
 - Surface area factor = 1
 - Quench Rate = 1000 K/s

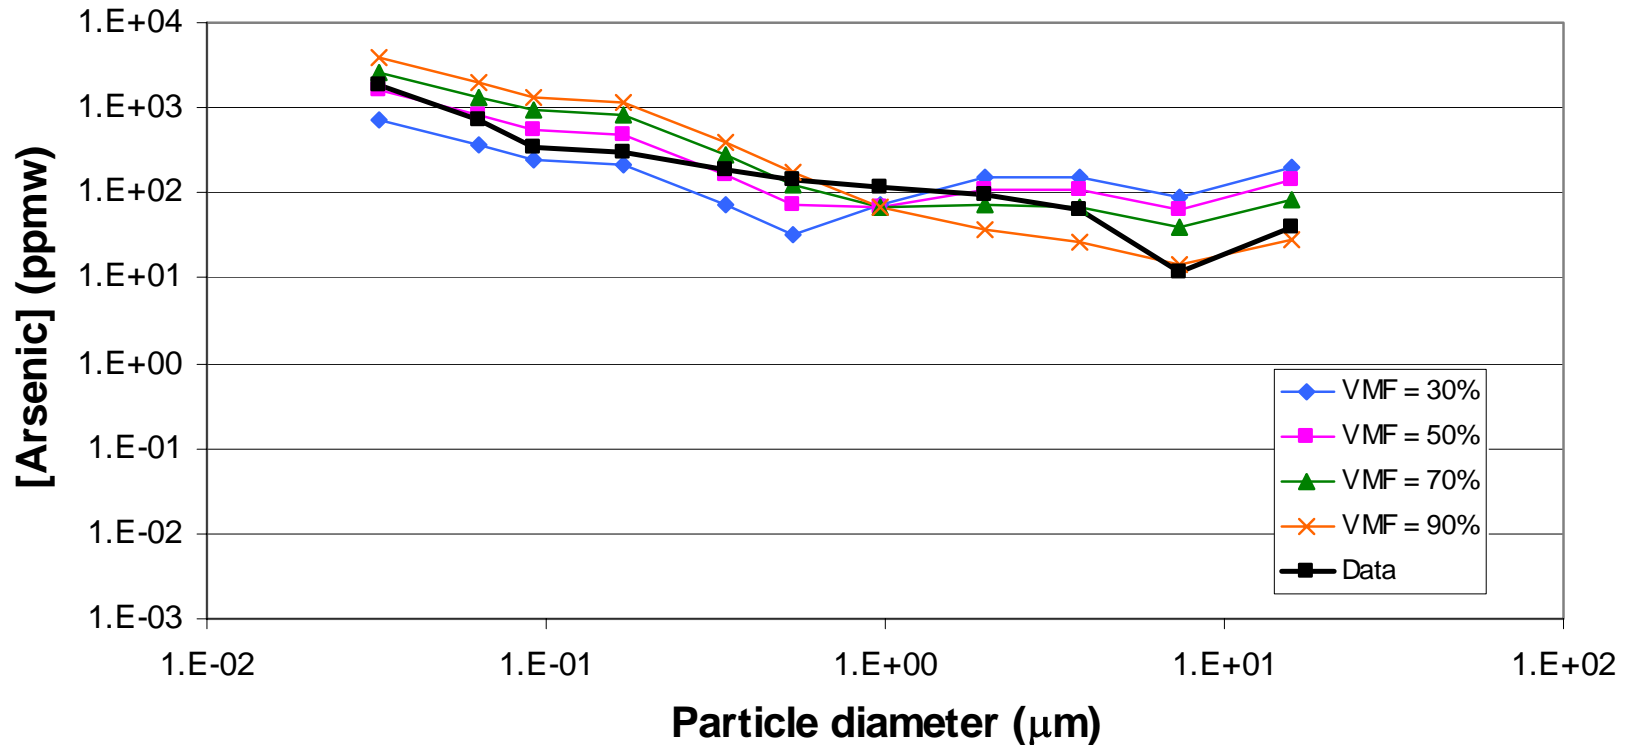

Condensation plus “apportionment” indicated; surface reaction?

Varying Vaporized Metal Fraction

- Kentucky Coal
Port 4, Run 4

- Surface area factor = 1
- Quench Rate = 1000 K/s

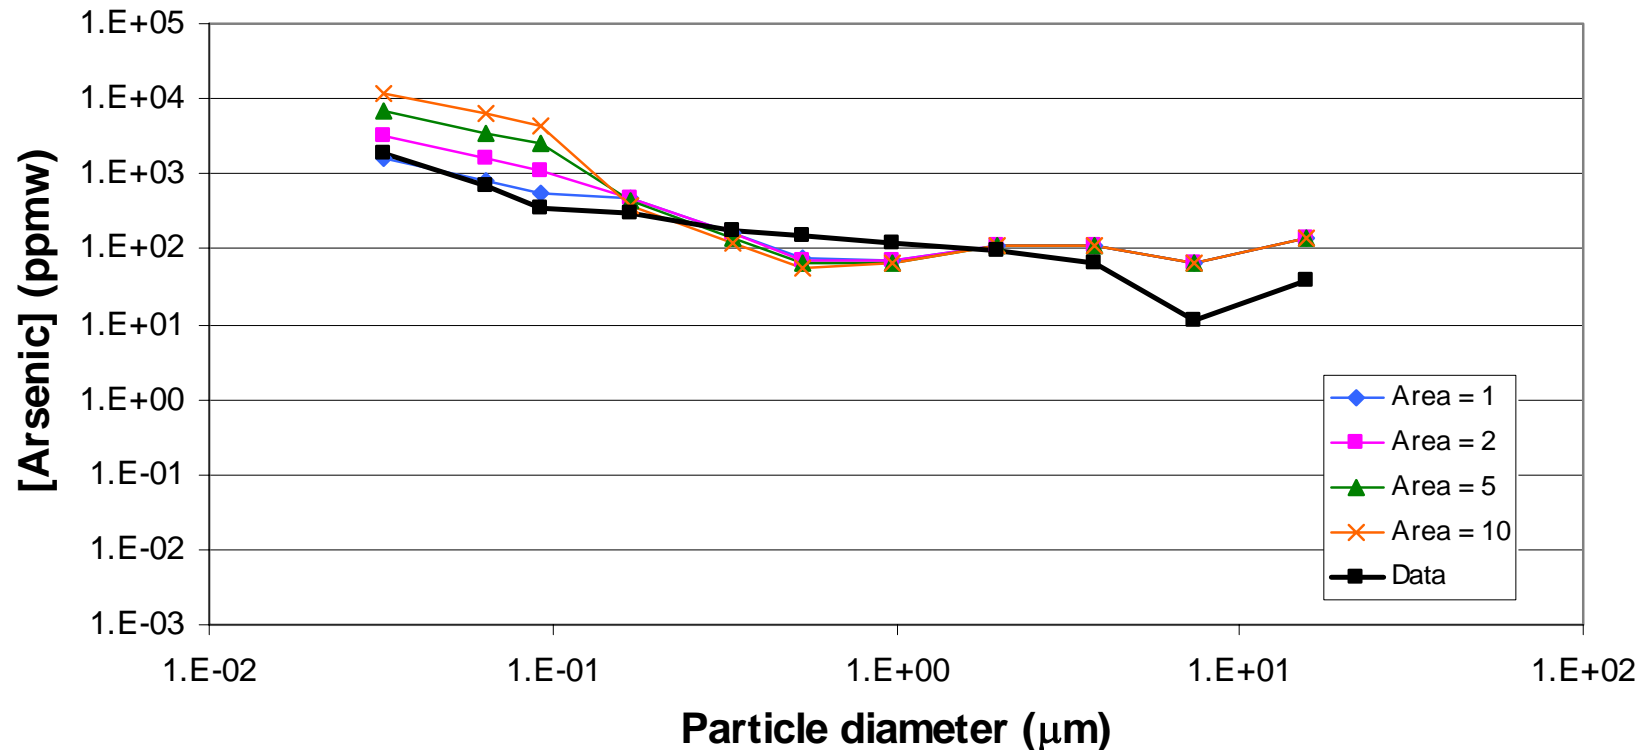

Relative insensitivity to fraction of arsenic vaporized

Varying Surface Area Factor

- Kentucky Coal
Port 4, Run 4

- Vaporized metal fraction = 50%
- Quench Rate = 1000 K/s

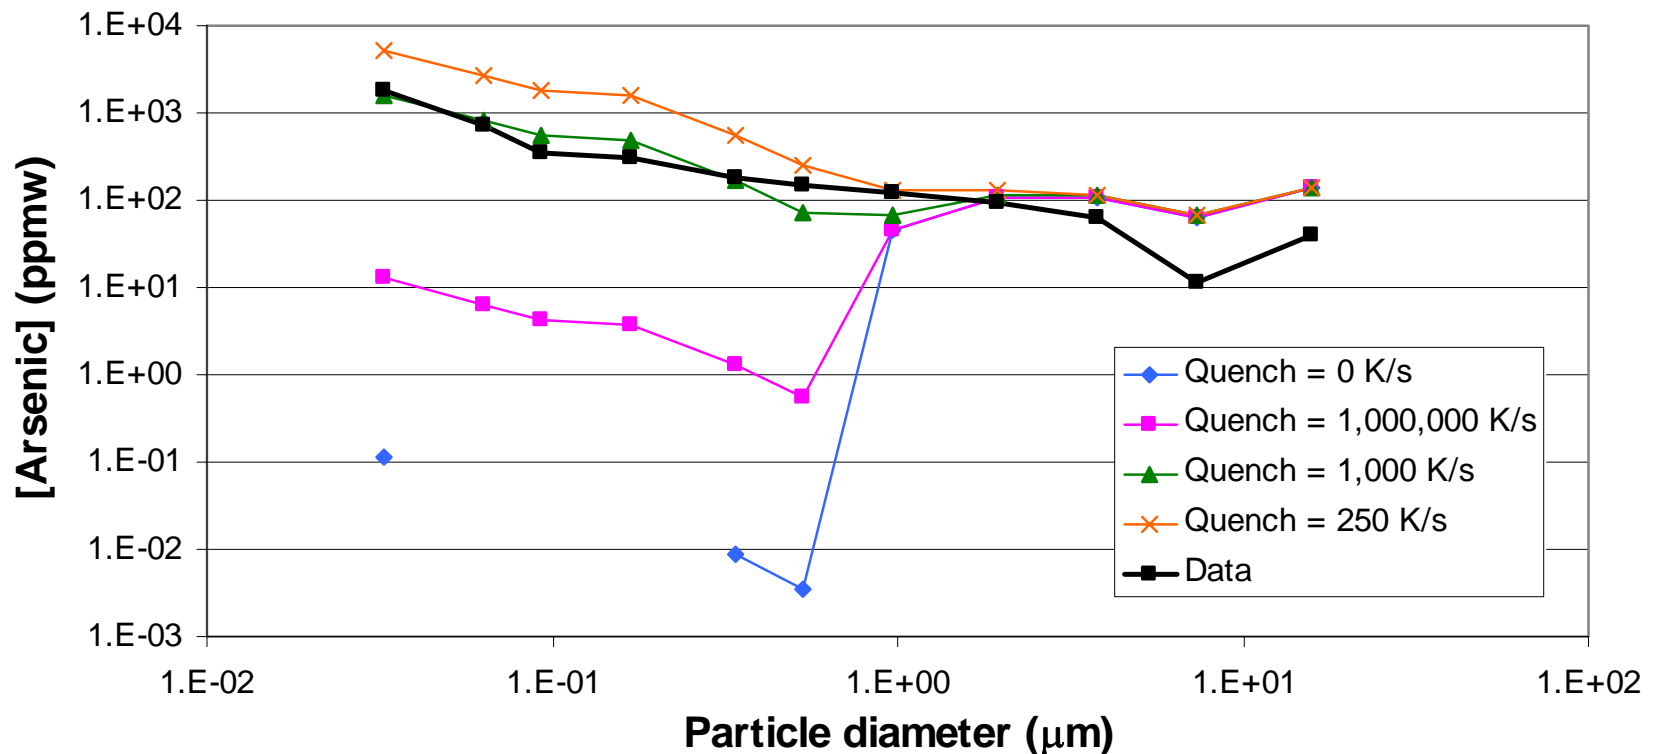

Additional A_{surf} increases [As] in submicron fraction as expected

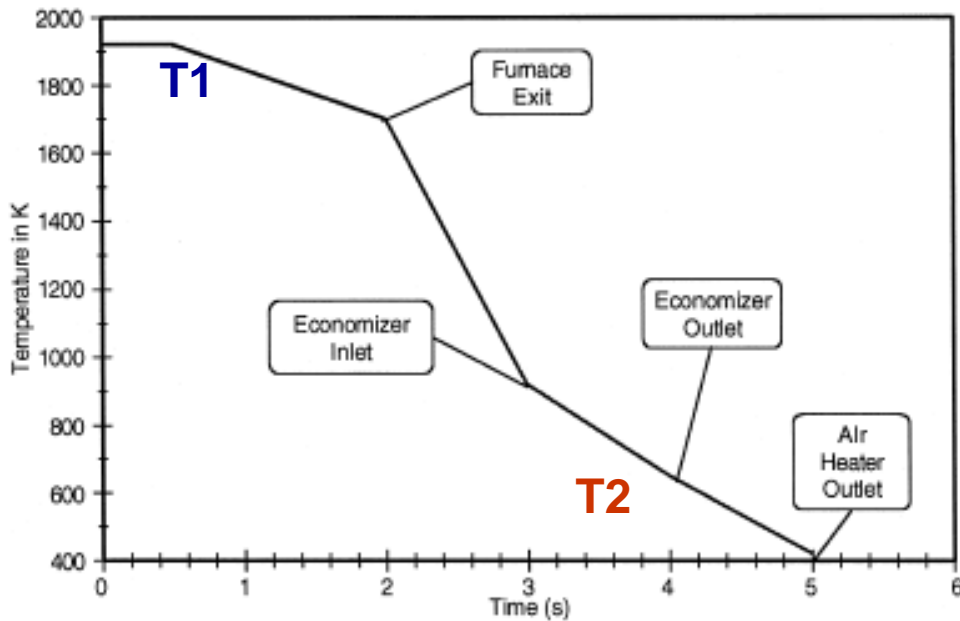

Varying Quench Rate

- Kentucky Coal
Port 4, Run 4

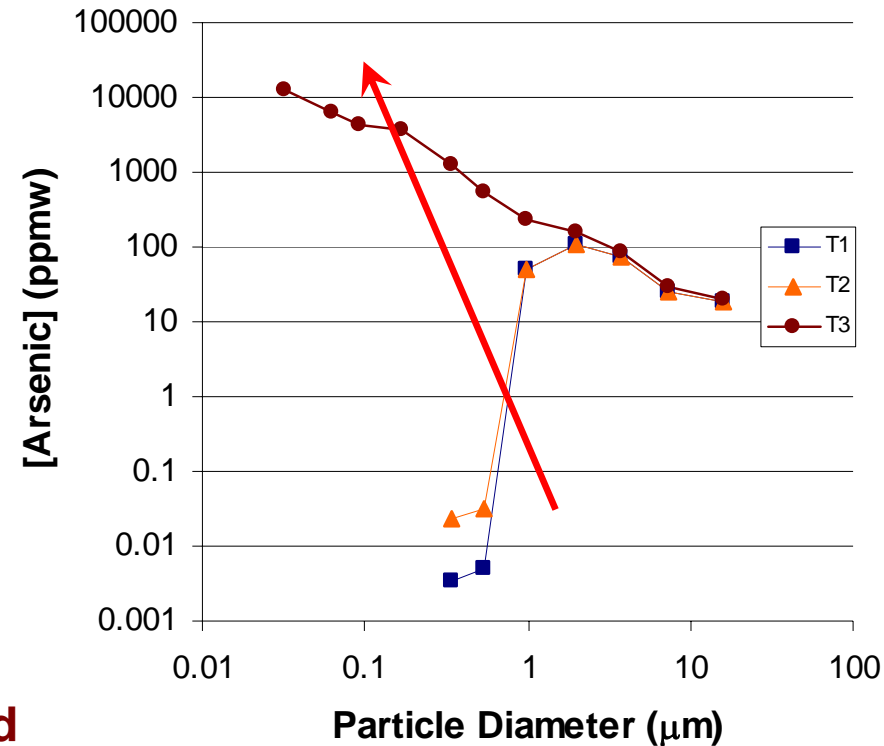

- Vaporized metal fraction = 50%
- Surface area factor = 1

Concentrations down the Reactor

**T3 =
extrapolated
to 300K**

Arsenic remaining in the vapor phase (% of total As)

T1
70%

T2
70%

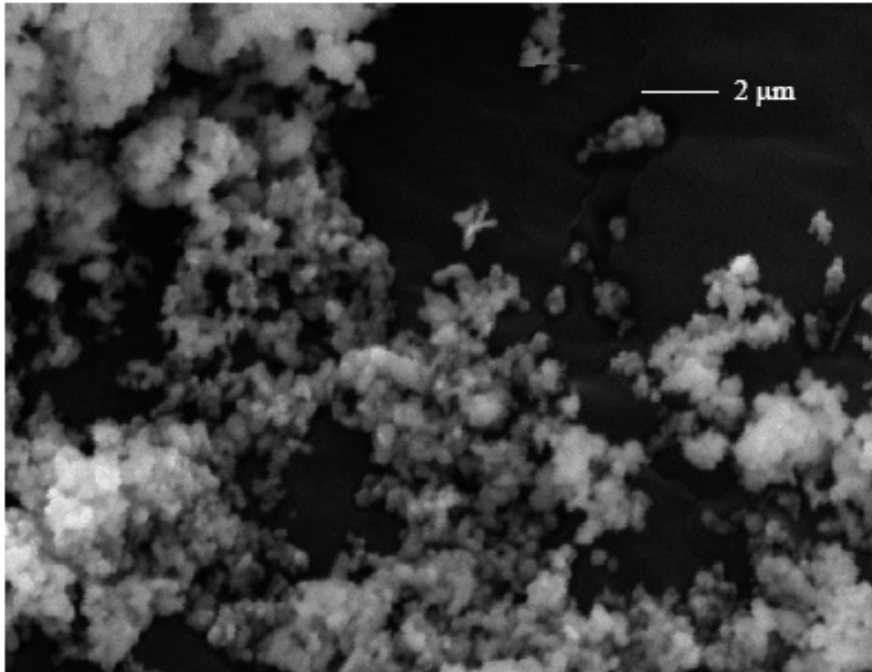

T3
8.7%

Approach: Laboratory

- Determining Surface Reaction Rates
 - Synthetic fly ash materials
 - Trace metals
- Suspected reaction participant
 - $\alpha\text{-Fe}_2\text{O}_3$
 - $\gamma\text{-Fe}_2\text{O}_3$
 - CaO
- Negative controls
 - Kaolinite
 - Montmorillonite

Characterizing Synthetic Fly Ash

- X-ray diffraction

- Size distribution
 - Optical microscopy
 - SEM microscopy
 - Cascade impaction
- BET N_2 Analysis

$\alpha\text{-Fe}_2\text{O}_3$ after particle size sorting

Particle Size Distribution

- Cascade Impaction

Sample	Stages with Visible Particles	Sample Weight in Visible Stages (%)	Particle Diameter Range (μm)
CaO	6-9	77.6	0.2-2.1
$\alpha\text{-Fe}_2\text{O}_3$	5-9	60.7	0.06-1.6
$\gamma\text{-Fe}_2\text{O}_3$	2-9	75.5	0.04-2.3
Kaolinite	5-9	67.0	0.1-2.4
Montmorillonite	7-9	60.5	0.6-2.7

- BET N_2 Analysis

Sample	Surface area (m^2/g)
CaO	11.9
$\alpha\text{-Fe}_2\text{O}_3$	5.1
$\gamma\text{-Fe}_2\text{O}_3$	7.9
Kaolinite	26.3
Montmorillonite	28.9

Status

- Dynamic model structured and running
- Ability to predict:
 - *concentration distributions*
 - *remaining vapor fraction*
 - *effect of T gradients*
- Examine importance of surface reaction
- Account for non-vaporized fraction
- Questions regarding vaporization, surface reaction rates remain

Future Work

- Surface Reaction Rates for suspected dominant reactions
 - Arsenic with Iron Oxides
 - Are Ca – As values reported in literature accurate?
 - If so, is surface reaction feasible?
- Expand model
 - Cover additional coal types
 - Examine additional metals volatile at T_c , lower P^{sat}
 - Hg

Bottled Gas Fixed Bed System
